EXPERIENCE

Data Engineer

Primerica | June 2025 – Present

- Developed and maintained scalable ETL/ELT pipelines within Databricks to support enterprise analytics and reporting workflows
- Designed and implemented Medallion Architecture (Bronze, Silver, Gold) data pipelines, including staging, cleansing, aggregation, and business-rule transformations for enterprise data processing
- Built and optimized data marts and dimensional models using star schema principles for BI reporting and downstream analytics
- Worked with Dynatrace RUM 2 and RUM 3 data pipelines and integrations, supporting observability, enterprise monitoring, and analytics workflows through APIs, webhooks, Amazon S3, and IBM systems
- Worked with QLIK Replicate to support database replication, ingestion, and synchronization across enterprise data environments
- Developed SQL and Spark-based transformations for large-scale datasets, including joins, KPI calculations, validation logic, and performance optimization
- Created Power BI dashboards and reporting solutions using curated warehouse and data mart structures to support business insights and decision-making
- Utilized SQL Server, Databricks, and cloud-based data platforms to support enterprise data integration, analytics, and reporting operations
- Worked with Jenkins, Kubernetes, GitHub Actions, and Postman to support CI/CD workflows, API testing, deployment automation, pipeline orchestration, and enterprise platform operations
- Served as a primary contributor and point of contact for Palantir Foundry platform operations, supporting administrative workflows, troubleshooting, cross-functional collaboration, and enterprise data, analytics, and AI-driven operational initiatives within the Palantir Foundry ecosystem
- Designed and delivered AI strategy education sessions for senior leaders and executives covering GitHub Copilot adoption, practical AI use cases, and implementation frameworks to drive enterprise-wide AI integration and informed decision-making

Engineering Research Assistant

Mercer University | August 2023 – May 2024

- Collected, cleaned, and labeled real-world EMG sensor data for applied machine-learning experiments
- Supported development of gesture-recognition models using TensorFlow Lite on embedded systems
- Worked with biomedical signal data in applied research settings rather than synthetic datasets
- Collaborated with faculty on applied ML research involving instrumentation, sensors, and embedded platforms

IT Finance Engineer Intern

Sephora (HQ) | June 2023 - August 2023

- Developed SAP ABAP programs to generate vendor and customer line item reports supporting IT finance operations
- Designed and modified SAP tables to improve accuracy and traceability of financial reporting workflows
- Automated data collection and reporting processes, eliminating manual Excel-based workflows and reducing operational overhead
- Built and optimized ABAP and SQL logic to extract, transform, and validate financial data across enterprise systems

CONTRACT/FREELANCE AI WORK

Freelance AI Engineer/AI Consultant

Independent | 2024 – Present

AI Data Trainer/Evaluator

- Contributed to AI model training and evaluation workflows by reviewing, rating, and refining model outputs across conversational and task-based prompts
- Applied domain knowledge in software engineering and data to assess response quality, accuracy, and alignment with intended behavior

AI Hospital Scheduling Optimization Agent

- Built an AI agent that generates and adjusts hospital staffing schedules using constraint-based reasoning and rule-driven optimization
- Modeled complex scheduling relationships including shift coverage requirements, availability constraints, and student-to-physician assignments
- Designed scalable algorithms to minimize conflicts, improve fairness, and reduce manual administrative overhead

AI Matchmaking System

- Designed and deployed an AI-powered matchmaking system analyzing structured participant preference data to generate compatible attendee matches for live events
- Built a data ingestion pipeline integrating JotForm and Google Sheets to normalize responses and prepare features for AI evaluation
- Integrated OpenAI API reasoning workflows in n8n with structured prompting and automated export via Twilio and Canva

AI PROJECTS

CognitiveLens: Biomedical RAG System for Dementia Research

- Built an end-to-end Retrieval-Augmented Generation (RAG) pipeline that answers natural language questions about dementia grounded in real PubMed medical literature using the Biopython Entrez API to fetch and normalize 466 abstracts across 10 research topics
- Designed a semantic search pipeline using LangChain text chunking, Sentence Transformers (all-MiniLM-L6-v2) embeddings, and ChromaDB persistent vector store to index 2,228 overlapping chunks with cosine similarity retrieval
- Integrated Anthropic Claude API (claude-opus-4-8) with adaptive thinking to generate cited, evidence-grounded answers from top-5 retrieved abstracts, with source attribution linking back to original PubMed records
- Built a FastAPI backend with /query and /retrieve endpoints and a Streamlit frontend with expandable source cards, relevance scores, and direct PubMed links for each retrieved paper

ScholarAgent: Agentic AI Study Scheduler

- Built a full-stack agentic AI study scheduler that ingests D2L ICS calendar feeds and processes assignments through a three-agent pipeline (FilterAgent, EstimatorAgent, SchedulerAgent) powered by the Anthropic Claude API
- Implemented adaptive recalibration that detects estimation drift from logged hours and percent completion, rebuilding the full remaining schedule automatically when the user falls behind
- Developed a React + Vite frontend with FullCalendar.js, optional Google Calendar sync, Gmail digest delivery, and real-time agent reasoning streamed to the UI during schedule generation
- Deployed on Vercel and Railway with Supabase handling auth and persistent storage of schedule history, assignment data, and progress logs

NarrativeOS: AI Writing Agent for Long-Form Fiction

- Built a full-stack AI co-writing platform with a pluggable multi-provider LLM layer supporting Anthropic Claude, OpenAI GPT-4o, and Google Gemini 2.5, with separate model tiers for prose generation and fast structured tasks
- Implemented Anthropic prompt caching across system prompts and user message prefixes, reducing input token costs by roughly 90% on repeated generation calls
- Integrated OpenAI gpt-image-1 for automated character portrait generation from structured prompts derived from each character's physical description, personality traits, and story role
- Integrated ElevenLabs for text-to-speech narration and speech-to-text transcription with a custom word-level timestamp parser and disk cache to avoid redundant API calls
- Designed a parallelized approval pipeline using Python asyncio that concurrently runs six AI agents for memory extraction, continuity checking, relationship analysis, and outline updates the moment a scene is approved

LLM Optimization & Stability Benchmarking Platform

- Built an end-to-end LLM benchmarking platform using Python and Streamlit evaluating prompt strategies across multiple open-source models on NLP tasks including sentiment classification, summarization, and question answering
- Implemented multi-dimensional evaluation metrics including ROUGE scores, LLM-as-judge scoring, classification accuracy, latency, throughput, and energy consumption per inference
- Designed a full-stack experiment tracking system with a MySQL backend and REST API to store, query, and compare prompt experiment runs across model configurations and dataset inputs

TECHNICAL SKILLS

Programming Languages: Python, SQL, Java, JavaScript, TypeScript, Node.js, SAP ABAP, Scala

Data Engineering and Databases: Databricks, Apache Spark, AWS S3, DB2, Denodo, IBM Systems, QLIK Replicate, SQL Server, Relational Databases, ETL/ELT Pipelines, Medallion Architecture, Data Transformation, Data Validation, Star Schema Modeling, Dimensional Modeling

Artificial Intelligence and Machine Learning: Large Language Models (LLMs), Hugging Face Transformers, PyTorch, TensorFlow Lite, wav2vec, SpecAugment, Model Fine-Tuning, Prompt Engineering, Prompt Caching, LLM-as-Judge Evaluation, Natural Language Processing (NLP), Semantic Embeddings, Sentence Transformers, KeyBERT, TF-IDF, Supervised Learning, Deep Learning, Model Evaluation, Constraint-Based Reasoning

Backend, APIs, and Software Development: REST APIs, API Design, Node.js Backend Development, OpenAI API, Anthropic Claude API, Google Gemini API, ElevenLabs API, System Design, Software Architecture

Cloud, DevOps, and Tools: Docker, Jenkins, Kubernetes, GitHub Actions, CI/CD Pipelines, Vercel, Railway, Supabase, Google OAuth, Linux, WSL, Streamlit, n8n, Postman, Jira, Confluence, Git, Agile Development, Palantir Foundry, Dynatrace

Data Science and Analytics: Pandas, NumPy, Scikit-learn, ROUGE Scoring, Feature Engineering, Statistical Analysis, Performance Metrics, Experimentation, Power BI

EDUCATION

Master of Science in Artificial Intelligence

Kennesaw State University | July 2026

Master of Science in Software Engineering

Kennesaw State University | May 2025

Bachelor of Science in Biomedical Engineering

Mercer University | May 2024

Concentration: Instrumentation and Embedded Systems
